# Synthesis and Crystal Structure of Cobalt(III) Complexes of Salen Type Schiff Bases and Tertiary Phosphanes as Ligands 

A.H. Kianfar ${ }^{\text {a }}$ * and H.R. Khavasi ${ }^{\text {b }}$<br>${ }^{\text {a }}$ Department of Chemistry, Isfahan University of Technology, Isfahan, Iran, 84156-83111<br>${ }^{\mathrm{b}}$ Department of Chemistry, Shahid Beheshti University, G. C., Evin, Tehran 1983963113, Iran<br>(Received 19 April 2015, Accepted 4 July 2016)

$\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{X}\left(\mathrm{X}=\mathrm{ClO}_{4}, \mathrm{BF}_{4}\right),\left[\mathrm{Co}(\mathrm{Salpn})\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}$ and $\left.\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)_{2}\right] \mathrm{ClO}_{4}\right)$ complexes (where salen $=$ bis(salisylaldehyde)ethylenediimine) and salpn $=$ bis(salisylaldehyde) 1,3 -propanediimine)) were synthesiszed and chracterized by IR, UV-Vis, ${ }^{1} \mathrm{H}$ NMR spectroscopy and elemental analysis. The IR and ${ }^{1}$ H NMR spectra cofirmed that the synthesised complexes contain Schiff base ligand, phosphane and the corresponding counter ion and the elemental analysis is in good agreement with the theoretical data calculated for the proposed formula. The coordination geometry of $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}$ and $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PMe}_{2} \mathrm{Ph}_{2}\right] \mathrm{ClO}_{4}\right.$ and complexes were determined by X-ray crystallography. It has been found that all the complexes are hexa coordinate in the solid state. Cobalt atom exhibits a distorted octahedral geometry and the salen ligand acts as $\mathrm{N}_{2} \mathrm{O}_{2}$ donor, occupying the the equatorial positions.

Keywords: Schiff base, Phosphane, Cobalt(III) complexes, X-Ray crystal structure

## INTRODUCTION

Cobalt complexes with ligands derived from salicylaldehyde have been well studied [1]. They are regarded as models for the Cobalamine ( $\mathrm{B}_{12}$ ) coenzymes [2-4] classified as an oxygen carrier [5] and used as a catalyst for the preparative oxygenation of phenols [6] indols [7] and amines [8]. The catalytic activity of Co (III) with salen complexes has been investigated. The reported results show that the catalytically active species contains cobalt in the Co(III) oxidation state [9-15].

Monophosphane cobalt(III) Schiff base complexes with the general formula of $\left[\mathrm{CoL}\left(\mathrm{PR}_{3}\right)\left(\mathrm{OH}_{2}\right)\right]^{+}$(where $\mathrm{L}=$ tetradentate $\mathrm{N}_{2} \mathrm{O}_{2}$ Schiff bases) show that these types of complexes are in eqilibrium with phosphanes and amines to form $\left[\mathrm{CoL}\left(\mathrm{PR}_{3}\right)_{2}\right]^{+}$and $\left[\mathrm{CoL}\left(\mathrm{PR}_{3}\right)(\text { amine })\right]^{+}$[16-21], but there is not any information about their structure. So to extend the studies on the structure of these type of complexes, Salen (bis(salicylaldehyde)ethylenediimine) and

[^0]Salpn (bis(salicylaldehyde)propanediimine) Schiff bases were prepared by the condensation of 2-hydroxybenzaldehyde within 1,2-ethylenediamine and 1,3-propanediamine respectively. The trtiary phosphane cobalt(III) complexes of these ligands were prepared in methanol solvent (Fig. 1). The resulting complexes were identifid by IR, ${ }^{1} \mathrm{H}$ NMR, UV-Vis spectroscopy and elemental analysis. The coordination geometry of $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)_{2}\right] \mathrm{ClO}_{4}$ and $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}$ were determined by X-ray crystallography.

## EXPERIMENTAL

## Chemicals and Apparatus

All of the chemicals and solvents used for synthesis were commerically available reagent grade and used without purification. Infrared spectra were recorded as KBr discs on a FT-IR JASCO-680 spectrophotometer in the $4000-400 \mathrm{~cm}^{-1}$. The elemental analysis was determined on a CHN-O-Heraeus elemental analyzor. UV-Vis spectra were recorded on a JASCO V-570 spectrophotometer in the 190-

Fig. 1. The structure of Schiff bases and their complexes.

900 nm . The ${ }^{1} \mathrm{H}$ NMR spectra were recorded in $\mathrm{CDCl}_{3}$ on DPX-400 MHz FT-NMR. The X-ray diffraction measurements were made on a STOE IPDS-2T diffractometer with graphite monochromated $\mathrm{Mo}-\mathrm{K}_{\alpha}$ radiation.

## Synthesis

The Schiff base ligands, $\mathrm{H}_{2}$ Salen and $\mathrm{H}_{2} \mathrm{Salpn}$, were prepared according to the literature [22] by the condensation of 1,2-etyhylenediamine, 1,3-propanediamine and 2hydroxybenzaldehyde, ( $2: 1$ mole ratio) in methanol and recrystalized by dichloromethane/methanol mixed solvent through the partial evaporation of dichloromethane.

The general procedure for synthesis of $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}, \quad\left[\mathrm{Co}(\right.$ Salpn $\left.)\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}$, $\left[\mathrm{Co}(\right.$ Salen $)\left(\mathrm{PMe}_{2} \mathrm{Ph}_{2}\right] \mathrm{ClO}_{4}$ and $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{BF}_{4}$ complexes is as follows: an appropriate amount of cobalt(II)acetatetetrahydrate $\quad\left(\begin{array}{llll}0.249 & \mathrm{~g}, & 1.0 & \mathrm{mmol}),\end{array}\right.$ tributylphosphane ( $0.5 \mathrm{ml}, 2.0 \mathrm{mmol}$ ) or dimethylphenylphosphane ( $0.31 \mathrm{ml}, 2.0 \mathrm{mmol}$ ) were added to a methanolic solution ( 40 ml ) of $\mathrm{H}_{2}$ Salen $(0.268 \mathrm{~g}, 1.0 \mathrm{mmol})$ or $\mathrm{H}_{2} \mathrm{Salpn}$ $(0.282 \mathrm{~g}, 1.0 \mathrm{mmol})$. The reaction was refluxed for 1 h . The formed Co (II) complex was oxidized by blowing air into the solution for 2 h , and the final reaction mixture was filtered. An appropriate amount of sodium perchlorate monohydrate $(0.140 \mathrm{~g}, 1.0 \mathrm{mmol})$ or sodium tetraflouroborate $(.110 \mathrm{~g}, 1.0$ mmol ) was then added to the filtrate. Red crystals were formed after 48 h . These crystals were filtered off, whashed with methanol, and recrystalized from of dichloromethane/ethanol (2:1 ratio) and dried in vacum at $65^{\circ} \mathrm{C}$.

## Crystal Structure Determination and Refinement

 of $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)_{2}\right] \mathrm{ClO}_{4}$ and $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}$ ComplexesThe X-ray diffraction measurements were made on a STOE IPDS-2T diffractometer with graphite monochromated $\mathrm{Mo}-\mathrm{K}_{\alpha}$ radiation.

For $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)_{2}\right] \mathrm{ClO}_{4}$ complex red plate crystal with a dimension of $0.50 \times 0.30 \times 0.15 \mathrm{~mm}$ were chosen and mounted on a glass fiber and used for data collection. Cell constants and an orientation matrix for data collection were obtained by least-squares refinement of diffraction data from 8668 unique reflections. Data were collected at a temperature of $120(2) \mathrm{K}$ to a maximum $2 \theta$ value of $58.34^{\circ}$ in a series of $\omega$ scans in $1^{\circ}$ oscillations and integrated using the Stoe X-AREA [23] software package. The numerical absorption coefficient, $\mu$, for $\mathrm{Mo}-\mathrm{K}_{\alpha}$ radiation is $0.758 \mathrm{~mm}^{-1}$.

For $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PBu}_{3}\right)_{3}\right] \mathrm{ClO}_{4}$ complex red block crystal with a dimension of $0.45 \times 0.10 \times 0.36 \mathrm{~mm}$ were chosen and mounted on a glass fiber and used for data collection. Cell constants and an orientation matrix for data collection were obtained by least-squares refinement of diffraction data from 12280 unique reflections. Data were collected at a temperature of $120(2) \mathrm{K}$ to a maximum $2 \theta$ value of $29.17^{\circ}$ in a series of $\omega$ scans in $1^{\circ}$ oscillations and integrated using the Stoe X-AREA [23] software package. The numerical absorption coefficient, $\mu$, for $\mathrm{Mo}-\mathrm{K}_{\alpha}$ radiation is 0.544 $\mathrm{mm}^{-1}$.

A numerical absorption correction was applied using XRED [24] and X-SHAPE [25] softwares. The data were corrected for Lorentz and Polarizing effects. The structures were solved by direct methods [26] and subsequent difference Fourier maps and then refined on $F^{2}$ by a full-
matrix least-squares procedure using anisotropic displacement parameters [27]. All of hydrogen atoms were located in a difference Fourier map and then refined isotropically. Atomic factors are from International Tables for X-ray Crystallography [28]. All refinements were performed using the X-STEP32 crystallographic software package [29].

A summary of the crystal data, experimental details and refinement results are given in Tables 1 and 2 for $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)_{2}\right] \mathrm{ClO}_{4}$ and $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PBu}_{3}\right)_{3}\right] \mathrm{ClO}_{4}$ complexes, respectively. It is notable that although the structure was refined correctly for $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)_{2}\right] \mathrm{ClO}_{4}$, the high values of $\mathrm{R}_{\text {int }}(0.2152)$ and $\mathrm{R}_{\text {sigma }}(0.1404)$ are due to cracking of the crystal. In the case of $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PBu}_{3}\right)_{3}\right] \mathrm{ClO}_{4}$ complex however, the asymmetric unit also contains solvents molecules, which could not be modeled. Therefore, the diffraction contribution of the solvent water molecules was removed by the subroutine SQUEEZE in PLATON

## RESULTS AND DISCUSION

## IR Characteristics

The IR spectra of the cobalt(III) Schiff base complexes synthezised here are listed in section 2.2. The IR spectra of the cobalt(III) complexes exhibit several bands in the 400$4000 \mathrm{~cm}^{-1}$ region.

The characteristic $\mathrm{C}=\mathrm{N}$ vibration appears in 1597-1628 $\mathrm{cm}^{-1}$ region for the synthesised complexes. The $\mathrm{C}=\mathrm{N}$ stretching in the complexes is generally shifted to a lower frequency relative to the free Schiff bases, indicating a decrease in the $\mathrm{C}=\mathrm{N}$ bond order due to the coordinate bond formation between the metal and the imine nitrogen lone pair [30]. The C-H stretching of the coordinated $\mathrm{PBu}_{3}$ ligands appears in 2867-2959 $\mathrm{cm}^{-1}$ region. The strectching vibrations of $\mathrm{BF}_{4}^{-}$and $\mathrm{ClO}_{4}{ }^{-}$counter ions appear at about 1058 and $1085 \mathrm{~cm}^{-1}$, respectively.

## Electronic Spectra

The spectral data of the synthesized complexes are listed in section 2.2. In all complexes, the band in the 253-255 nm region, involves $\pi \rightarrow \pi^{*}$ transition related to the aromatic rings. The band in the $304-307 \mathrm{~nm}$ region, involves $\pi \rightarrow \pi^{*}$ transition related to azomethine group. The cobalt(III)

complexes show an absorption band related to charge transfer transition (LMCT) at about 395-412 nm region [16, 31-37].

## ${ }^{1} H$ NMR Spectra

The chemical shift ( $\delta, \mathrm{ppm}$ ) of different protons of the cobalt(III) complexes is presented in section 2.2.

Fig. 2. The labeled diagram of $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)_{2}\right] \mathrm{ClO}_{4}$. Thermal ellipsoids are at $30 \%$ probability level.

Fig. 3. Crystal packing diagram of $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)_{2}\right] \mathrm{ClO}_{4}$.

The ${ }^{1} \mathrm{H}$ NMR of complexes is in line with the proposed structures. The hydrogens of the tributhyl phosphane appear in the range of $0.80-1.68 \mathrm{ppm}$. The $\mathrm{CH}_{3}$ of buthyl appears as a triplet and the methylene groups as multiplet in three set. The hydrogens of methyl groups of $\mathrm{PMe}_{2} \mathrm{Ph}$ appear as a triplet (two mixed doblet) and it is evident that the hydrogens of methyls have a little different chemical invironment and so different chemical shift. The bridging ethylene protons in salen complexes appear as a singlet at about $3.58-3.92 \mathrm{ppm}$. The bridging propylene protons in salpn complex appear at 2.22 and 3.82 ppm as singlets. The hydrogens of aromatic rings appear as triplet, doublet, doublet and triplet in the range of 6.42-7.23 and are attributed to the $H_{a}, H_{b}, H_{c}, H_{d}$, respectively (Fig. 1). The azomethine hydrogens are seen as a singlet. These hydrogens are shifted to high field in $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)_{2}\right] \mathrm{ClO}_{4}$ because of phenyle ringes of dimethylphenylphophane ligands.

## Description of the Molecular Structure of $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)_{2}\right] \mathrm{ClO}_{4}$

The complex $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)\right] \mathrm{ClO}_{4}$ crystallizes in the Monoclinic space group $P 2_{1} / a$. Relevant X-ray diffraction data and selected bond lengths and angles are listed in Tables 1 and 2, respectively. The structure of this complex is shown in Fig. 2, which includes the atom labelling scheme. The packing diagram of complex is shown if Fig. 3. In the six-coordinate $\left[\mathrm{Co}(\right.$ Salen $)\left(\mathrm{PMe}_{2} \mathrm{Ph}_{2}\right] \mathrm{ClO}_{4}$, cobalt atom exhibits a distorted octahedral geometry, the salen ligand has the $\mathrm{N}_{2} \mathrm{O}_{2}$ coordinated in the equatorial plane. $\mathrm{P}-\mathrm{Co}-\mathrm{N} / \mathrm{O}$ angles are distributed from $85.5(1)$ to $96.2(2)^{\circ}$. The $\mathrm{PMe}_{2} \mathrm{Ph}$ groups occupy the two opposite axial positions. The Co-N1, CoN2, Co-O1 and Co-O2 distances of 1.905(5), 1.909(5), 1.927(4) and $1.907(4) \AA$, respectively, are similar to those in N 2 O 2 -salen cobalt complexes [38-40]. The Co-P bond distances of apical positions are 2.289(1) and 2.303(1) for Co-P1 and Co-P2 respectively. The phenyl groups in axial ligands are oriented in one side of the molecule and the C17-P1-P2-C25 dihedral angle is $13.22^{\circ}$. The angle between phenyl main planes is $68.85^{\circ}$.

All angles around the cobalt center deviate significantly from $90^{\circ}$ indicating a rgular distortion. The ligand - cobaltligand bond angles in the equatorial plane consist of two
that are larger than $90^{\circ}(\mathrm{O} 1-\mathrm{Co} 1-\mathrm{N} 1)$ (93.6(22)), (O2-Co1$\mathrm{N} 2)$ (94.3(22)) and two smaller angles (O1-Co1-O2) (86.8(2)), (N1-Co1-N2) (85.3(2)) and are similar to those in N 2 O 2 -salen cobalt complexes [41]. Also the summation of these angles are $360^{\circ}$ and shows that the cobalt atom is in a square planare invironment of $\mathrm{N}_{2} \mathrm{O}_{2}$ atoms.

## Description of the Molecular Structure of $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}$

The complex $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}$ crystallizes in the Triclinic space group $P \overline{1}$. Relevant X-ray diffraction data and selected bond lengths and angles are listed in Tables 1 and 2, respectively. The structure of this complex is shown in Fig. 4, which includes the atom labelling scheme. The packing diagram of complex is shown if Fig. 5. In the sixcoordinate $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}$, cobalt atom exhibits a distorted octahedral geometry, the salen ligand has the $\mathrm{N}_{2} \mathrm{O}_{2}$ coordinated in the equatorial plane. $\mathrm{P}-\mathrm{Co}-\mathrm{N} / \mathrm{O}$ angles range from $84.5(1)$ to $95.2(2)^{\circ}$. The $\mathrm{PBu}_{3}$ groups occupy the two opposite axial positions. The Co-N1, Co-N2, Co-O1 and Co-O2 distances of 1.896 (2), 1.896 (2), 1.919 (2) and 1.914
(7) $\AA$, respectively, are slitely shorter than those in $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)\right] \mathrm{ClO}_{4}$ complex. The $\mathrm{Co}-\mathrm{P}$ bond distances of apical positions of 2.319 (0) and 2.336 (3) for $\mathrm{Co}-\mathrm{P} 1$ and $\mathrm{Co}-\mathrm{P} 2$, respectively are slitely longer than those in $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)\right] \mathrm{ClO}_{4}$ complex. This is may be due to the higher cone angle for $\mathrm{PBu}_{3}\left(145^{\circ}\right)$ than $\mathrm{PMe}_{2} \mathrm{Ph}\left(135^{\circ}\right)$ [42].

All angles around the cobalt center deviate significantly from $90^{\circ}$ indicating a rgular distortion. The ligand - cobaltligand bond angles in the equatorial plane consist of two that are larger than $90^{\circ}$ (O1-Co1-N1) (93.5 (3)), (O2-Co1N2) (93.0(6)) and two smaller angles (O1-Co1-O2) (87.9(7)), (N1-Co1-N2) (85.5(4)) and are similar to those in $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)\right] \mathrm{ClO}_{4}$ complex. The summation of these angles are $360^{\circ}$ with a square planare invironment for the cobalt atom.

## CONCLUSIONS

By considring the spectroscopic properties and structural behavior of cobalt(III) complexes the follwing conclusions have been drawn.
1- The IR and ${ }^{1}$ H NMR cofirmed that the synthesised

Fig. 4. The labeled diagram of $\left[\mathrm{Co}(\mathrm{Salen})\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}$. Thermal ellipsoids are at $30 \%$ probability level.

Fig. 5. Crystal packing diagram of $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}$.
complexes contain schiff base, phosphane and conter ion.
2- The synthezised complexes are hexacoordinated in the solid state.
3- Cobalt atom exhibits a distorted octahedral geometry.
4- The Schiff base ligands have the N 2 O 2 coordinated environment in the equatorial plane.

## SUPPLEMENTARY MATERIAL

CCDC No. 888598 and 888599 contains the supplementary crystallographic data for $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PMe}_{2} \mathrm{Ph}\right)_{2}\right] \mathrm{ClO}_{4}$ and $\left[\mathrm{Co}(\right.$ Salen $\left.)\left(\mathrm{PBu}_{3}\right)_{2}\right] \mathrm{ClO}_{4}$ respectively. These data can be obtained at www.ccdc.cam.ac.uk/deposit \{or from the Cambridge Crystallographic Data Center 12, Union Road Cambridge CB2 1EZ, UK; Fax: (internet) +44-1223/336-033; E. mail: deposit@ccdc.cam.ac.uk).
